

Updating the Roadrunner Comfort Controller

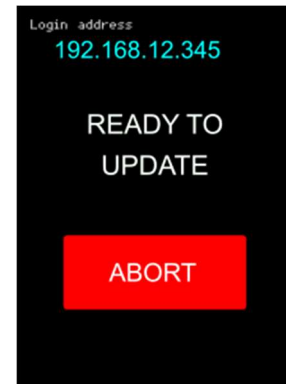

The controller should be updated at installation time.

Updating requires the controller connected to **Wifi** and a web browser.

1. Set the controller in update mode:

Select **Option** then **Setup** then **Update** then **YES**.

Controller will reboot to a screen that shows its address and an **ABORT** button.

2. On your device (phone, tablet or computer):

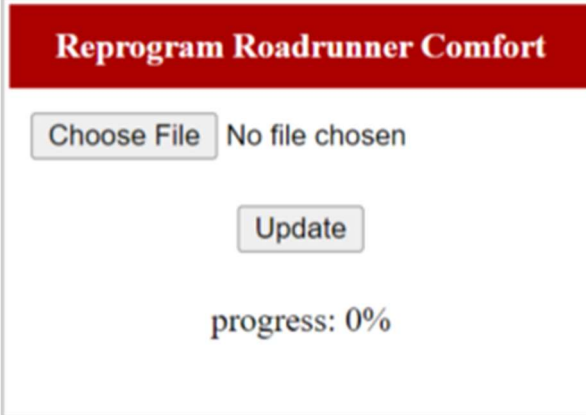

Download the latest update from www.roadrunnercomfort.com/support (under Setup)

Save it to your device as a file, then open a **web browser** on your device. In its address space (where you might type "www.website.com") enter the address shown on your controller screen. It may look something like **192.168.54.123** or **10.0.0.5**. Select enter or done, and you should shortly be presented with a page containing this:

Enter the username "**RRComfort**" and password "**APlausible14U**" and select "Login".

Soon this will appear:

Reprogram Roadrunner Comfort

Choose File No file chosen

Update

progress: 0%

Select **Choose File** to choose the file you just downloaded (something like “R2-0606.bin”), then select **Update**.

The update should start immediately. While updating, the controller shows a blue screen. This process should not be interrupted. It should complete in a minute or two.

UPDATING

When the update is finished the Roadrunner Comfort reboots, restoring all settings.

If for any reason the process does not complete after 5 minutes or more, you can press the reset button on the side of the controller and it should reboot into its prior state.
